To: John Angell <john.angell@csueastbay.edu>

Dear Dr. Angell-   I have simply submitted for an Advanced Certification program at the North Carolina State University - which I felt best suited for me to pursue the project.   UCSC has rescinded my guest access to their servers, thereby cutting me off from my work there- so despite my struggles I could not get my hands on the q-bit "hardware" code.

It consisted of all of about 50 lines of some c macro and inline structs defining a symbol 'i' as essentially a placeholder inside the hardware register channel-   where it is essentially read as a NULL value for all signals not clearly transmitted through the computing channel.

Since I could not locate the code from my former project I simply forwarded you the latex description of the project.

Thanks again for your time,
Former Masters Student-   Statistical Programming in R

R. Peter Gulla
